STCSFS-H	H

Ice Rod Strike Indicator System - How It Works

St. Croix's strike indicator system is adjustable, so its sensitivity level can accommodate different lure sizes. To make the bobber more sensitive, push the spring forward through the grommet. To make it less sensitive push it back. (Illustration 1). The system is most sensitive when there is a 30-degree bend (position 2) in the spring. To find the bottom, lower the jig until the indicator returns to position 1. Then, either slowly reel up once or lift the rod slightly until the indicator is back to position 2. (Illustration 2)

SOLID UNPAINTED FIBERGLASS ICE BLANKS

No finish. Paint your own color.
